ASYNCHRONOUS CONVERSATION

WALL OF INFO
YOU CAN MANIPULATE

- Physical Manipulation of data

See patterns

Structured Insights

- models - information we can actually use

VISUAL REPRESENTATION TO HELP REVEAL HIDDEN TRUTHS

Reveal
Things to
Think With.

GOAL OF THE RESEARCH

PUSH THINGS TO THINK WITH INTO IDEATION
QUANTITY!

Ideation should reveal:

- o Pain Points - only come during emergencies
- o opportunities - capture these people when they come to the site

BRAIN-STORMING SPRINTS

45 min - 1 hour, incentives, lots of ideas fast

- Quantity of ideas is important here.

BRAINSTORM FOR CATEGORIES
THEN CONVERT OUTPUTS TO A MATRIX

CHOOSING? Use Principles.
A combination of findings + ideation

FINDING: People hated missing fav shows.

PRINCIPLE: Make it easy for people to never miss favorite shows.
This led to the Season Pass on Tivo.

+ ADD CONSTRAINTS and then balance against the principles.
Adjust as needed (ideally constraints).

Refinement - learn what it takes to really make a design - witty gritty. Iteration using our standard tools + approaches.

DON'T ELIMINATE RISKS!

Try something risky - risking and failing will teach you. Fail faster!

50% FAILURE RATE.

POWERING OR CENSORING CITIZENS?

The drawing effect: Evidence for reliable and robust memory benefits in free recall

Jeffrey D. Wammes, Melissa E. Meade, and Myra A. Fernandes

Department of Psychology, University of Waterloo, Waterloo, ON, Canada
(Received 23 December 2014; accepted 31 August 2015)

In 7 free-recall experiments, the benefit of creating drawings of to-be-remembered information relative to writing was examined as a mnemonic strategy. In Experiments 1 and 2, participants were presented with a list of words and were asked to either draw or write out each. Drawn words were better recalled than written. Experiments 3–5 showed that the memory boost provided by drawing could not be explained by elaborative encoding (deep level of processing, LoP), visual imagery, or picture superiority, respectively. In Experiment 6, we explored potential limitations of the drawing effect, by reducing encoding time and increasing list length. Drawing, relative to writing, still benefited memory despite these constraints. In Experiment 7, the drawing effect was significant even when encoding trial types were compared in pure lists between participants, inconsistent with a distinctiveness account. Together these experiments indicate that drawing enhances memory relative to writing, across settings, instructions, and alternate encoding strategies, both within- and between-participants, and that a deep LoP, visual imagery, or picture superiority, alone or collectively, are not sufficient to explain the observed effect. We propose that drawing improves memory by encouraging a seamless integration of semantic, visual, and motor aspects of a memory trace.

Keywords: Subject-performed tasks; Memory; Drawing; Imagery; Levels of processing.

In the current study, we first sought to determine whether drawing was an efficacious strategy for boosting later retention and memory performance. Previous work has indicated that many subject-performed tasks, such as production (MacLeod, Gopie, Hourihan, Neary, & Ozbuko, 2010), generation (Slamecka & Graf, 1978), and enactment (Guttentag & Hunt, 1988), carried out during encoding can provide a memorial benefit relative to more passive encoding strategies.

be practical in a typical learning environment such as a classroom or lecture hall due to their disruptive nature. For this reason, there is a need to find practical unobtrusive techniques that people can apply in their everyday lives to remember important information, or that students can apply to enhance retention. One traditional study approach in the aforementioned area is the use of
